SUPPLEMENT TO REPORT NO.

THIS IS UNEVALUATED INFORMATION

- It has been reported from the Varpolletta maneuver area that a Russian rocket-launching ramp has been erected in Varpolletta. Its iron girders are sunk in the earth. During the winter V-winged rockets were fired regularly in the direction of Hajmasker. Some Hungarian engineers working at the Inota electric power station estimated the dimensions of the Russian rockets. The rockets are approximately 8 meters long and their wings are approximately 3 to 4 meters wide.
- At the end of July important experiments were being conducted in Hajmasker and 2. Warmilata (Trans-Danubia). Robot-controlled tanks, new types of mines, and rockets were tested.
